

The Flow Show

Those yields might not hurt yet, but diesel

Scores on the Doors: oil 80.9%, global stocks 14.7%, US stocks 10.9%, cash 2.5%, HY bonds 2.0%, US\$ 0.7%, gold -0.4%, IG -1.2%, govt bonds -1.9%, bitcoin -12.4% YTD.

The Biggest Picture: markets stop panicking when policymakers start panicking...but no panic anywhere despite the highest 30yr yield since Jun'07 and spiking commodities; oil at \$100/bbl takes headlines but diesel is the key real-economy pressure point: shipping, trucking, agriculture, construction, mining; note crude is well below Ukraine peaks vs. diesel at a \$6 record (Chart 2); blasé markets + bravado policy = recipe for volatility.

Tale of the Tape: markets usually test policy resolve: July 31st US-Japan intervention saw yen test 160 before success <154; 30yr Treasury yield jumped +16bps the day after QE3 news (2012), +51bps in days after QE4 (2020); in truth a big surge in yields is too harmful to both Main St & Wall St...the \$1tn Treasury General Account is waiting.

The Price is Right I: “peak yield” trades are working ahead of central bank hikes to restore credibility; but note the long-duration rally in XBI, KRE, REITs, small caps is unmatched by flows (Charts 3-6); not too late to hedge AI-soaked stock indexes.

The Price is Right II: but watch transportation stocks (IYT), which are now flirting with the 200-day moving average @ 80... a break below confirms summer “as good as it gets” macro derisking becomes an autumn stagflation event.

Chart 2: Diesel the key real-economy pressure point

US daily national average diesel and regular unleaded gasoline price (\$/gal)

Chart 1: BofA Bull & Bear Indicator

Down to 9.5 from 9.6

Source: BofA Global Investment Strategy. The indicator identified above as the BofA Bull & Bear Indicator is intended to be an indicative metric only and may not be used for reference purposes or as a measure of performance for any financial instrument or contract, or otherwise relied upon by third parties for any other purpose, without the prior written consent of BofA Global Research. This indicator was not created to act as a benchmark.

BofA GLOBAL RESEARCH

Weekly Flows: \$17.5bn to bonds, \$12.9bn to cash, \$9.8bn to stocks, \$1.3bn to crypto, \$0.6bn to gold.

Flows to Know:

- Crypto: \$1.3bn inflow, with strong \$6.8bn inflow past 6 weeks (Chart 12),
- Global bonds: \$17.5bn inflow, averaging \$18bn weekly inflow past 4 weeks;
- IG bonds: \$5.0bn inflow, 23rd week of inflows,
- Global equities: \$9.8bn inflow, averaging \$7bn weekly inflow past 3 weeks down from \$52bn average weekly inflow in Jul'26...inflows slowing,
- US equities: \$3.9bn outflow, with biggest 3-week outflow since Jan'26 (\$14.2bn),
- China equities: \$1.1bn inflow, first inflow in 6 weeks (Chart 13),
- Materials: \$1.9bn inflow, 10th week of inflows (Chart 14).

BofA Private Clients: \$4.7tn AUM...66.2% stocks, 17.2% bonds, 9.4% cash (record low); in Treasuries, private clients selling T-bills (biggest weekly outflow in 4 months) and T-notes (1st outflow in 5 weeks) vs small inflow into T-bonds; equity ETF share count up 0.1% past week, up 7.0% YTD; past 4 weeks private clients buying IG bond, municipal bond, TIPS, HY bond ETFs, and selling staples, healthcare, energy ETFs.

BofA Bull & Bear Indicator: down to 9.5 from 9.6 on slowing inflow to stocks and healthcare outflow; "sell signal" triggered May 26th; since then, SPX +1.0%, ACWI +1.5%; "old" Bull & Bear Indicator at 7.6 (see [BofA Bull & Bear Indicator report](#)).

On asset allocation: the diversification benefit of holding bonds is fading fast, so yields may stay high even if Treasury buying caps the surge; in the 2000-2019 "secular stagnation" era of rapid globalization & record-low inflation, bonds & stocks did not move together...a 2-3% yield was almost a bonus; today, returns are correlated again (Chart 8), and allocators may require higher yields before moving wholesale into bonds.

Flight to quality: stocks that can generate big free cash flow without excessive debt were the best-performing factor of the last 30 years, better than momentum, growth, dividends (Chart 9); today S&P 500 FCF yield is at record lows, high-FCF stocks (VFLO) are up 37% YTD; in a stagflation year like '22, the index rose 9% vs. SPY -18%.

On AI: despite \$1.5tn spent in past 3 years, scant evidence yet of economy-wide productivity gains; in fact, total factor productivity is falling below trend (Chart 10), a measure highly correlated the past 50 years with consumer confidence; sometimes Main St knows what Wall St doesn't.

Events:

- Sept 9th-Nov 4th: Bessent UST buyback program
- Sept 11th: US CPI
- Sept 16th: FOMC (75% probability of hike)
- Sept 18th: BoJ (96% probability of hike)
- Sept 24th: Trump-Xi summit
- Oct 28th: FOMC (6 days before midterms)
- Nov 3rd: US midterm elections

BofA GLOBAL RESEARCH

Disclaimer: The indicators identified above as the BofA Bull & Bear Indicator, MVP Model, BofA Global Breadth Rule, BofA EM Flow Trading Rule, BofA Global Flow Trading Rule, BofA Global FMS Macro Indicator, BofA Global FMS Cash Rule, Global Wave, Sell-Side Indicator, and Global Financial Stress Indicator are intended to be indicative metrics only and may not be used for reference purposes or as a measure of performance for any financial instrument or contract, or otherwise relied upon by third parties for any other purpose, without the prior written consent of BofA Global Research. These indicators were not created to act as a benchmark.

The analysis of the BofA Bull & Bear Indicator in this report is back-tested and does not represent the actual performance of any account or fund. Back-tested performance depicts the hypothetical back-tested performance of a particular strategy over the time period indicated. In future periods, market and economic conditions will differ and the same strategy will not necessarily produce the same results. No representation is being made that any actual portfolio is likely to have achieved returns similar to those shown herein. In fact, there are frequently sharp differences between back-tested returns and the actual results realized in the actual management of a portfolio. Back-tested performance results are created by applying an investment strategy or methodology to historical data and attempts to give an indication as to how a strategy might have performed during a certain period in the past if the product had been in existence during such time. Back-tested results have inherent limitations including the fact that they are calculated with the full benefit of hindsight, which allows the security selection methodology to be adjusted to maximize the returns. Further, the results shown do not reflect actual trading or the impact that material economic and market factors might have had on a portfolio manager's decision-making under actual circumstances. Back-tested returns do not reflect advisory fees, trading costs, or other fees or expenses.
